Web Content Analyzer & SEO Intelligence

Complete, Plain-English User Guide: How it works, what it measures, and how to use every feature.

1. What Is This Tool & What Does It Do?

The **Mindcob Web Content Analyzer** is an automated SEO intelligence tool. In plain English, it answers one simple question:

> **"When people search Google for a specific topic, what exact words, phrases, and topics are the top-ranking competitors using across their entire websites?"**

Instead of guessing what to write in an article, blog post, or service landing page, this tool scans the actual websites currently ranking on Google. It reads **20 to 40+ internal pages** for each competitor (not just their homepage), counts every word, and presents you with a clear roadmap of:

- Which keywords and phrases are **shared by all competitors** (core topics you must cover).
- How often each competitor uses those keywords (exact counts and percentage densities).
- Every single webpage that was crawled, with total word counts and direct links.
- Live Google autocomplete suggestions that real people are searching for.
- One-click publication-ready **Microsoft Word reports (.docx)** with embedded charts and spreadsheets (.csv) to hand directly to writers or clients.

> **100% Free Organic Engine:** You do NOT need any paid API keys (like Serper, Semrush, or Ahrefs). The built-in organic engine queries Google and crawls websites directly at zero cost.

2. Quick Start: How to Run an Analysis in 3 Steps

1. **Type Your Topic or Keyword:** In the *Search Query* box, enter the topic you want to rank for (e.g., `pos system montreal` or `business voip for law firms`).
2. **Pick Your Target Country:** Select where your target audience lives (e.g. *United States, Canada, United Kingdom, Australia*). Google search results change by country; the tool queries Google from that specific location.
3. **Click "Run Deep Analysis":** The crawler starts immediately. You will see a live progress bar and a log console showing every page being scraped in real time.

Within 30 to 60 seconds, the crawler finishes and reveals all charts, tables, and download buttons.

3. Detailed Explanation of Every Setting & Filter

Under the search bar, you have controls to customize how the scraper works. Here is what each setting does in simple terms:

Setting	Options	What It Means In Plain English
Competitor Sites	3 Sites · 5 Sites (Rec) · 8 Sites	How many top-ranking business websites to scrape. **5 Sites** is the recommended sweet spot—it gives a solid cross-industry average without taking too long.
Pages / Competitor	15 Pages · 25 Pages (Rec) · 40 Pages	How deep the crawler goes into each competitor's website. If you select 25 pages and 5 competitors, the tool automatically crawls up to **125 pages** total, reading their services, case studies, and blog posts.
Keyword Type (N-Gram)	All Keywords · Phrases (2-3 words) · Single Words	Controls whether the analysis looks for individual words or full search phrases: • **All Keywords:** Everything combined. • **Phrases (2-3 words):** *(Best for SEO)* Filters out generic words like "the" or "business" and reveals actual search phrases like "*cloud phone system*" or "*inventory management*". • **Single Words:** Individual core terms like "*hardware*", "*billing*", "*telephony*".
Crawler Speed	Fast (8) · Standard (5) · Polite (2)	How many web pages the scraper downloads at the exact same moment. **Fast (8 workers)** finishes in ~35 seconds. **Polite (2 workers)** crawls gently if you are scraping sensitive or smaller websites.
Custom Stopwords *(Advanced)*	Text input (comma separated)	Words you want the tool to completely ignore. For example, if competitors keep repeating their own company name (e.g. "*telus, rogers*") or boilerplate words ("*copyright, login, privacy*"), type them here to keep your report clean.
SERP API Key *(Optional)*	Serper API Key	**Leave this blank for 100% free use!** Only fill this in if you already own a paid Serper.dev API account and prefer using an official Google SERP API instead of free organic scraping.

4. Understanding the Results: What the Tabs & Charts Show

Once the scan completes, you get four interactive views:

Tab 1: Keyword Dominance Matrix (The Core Feature)

This is the most powerful part of the tool. It shows which keywords are used by **multiple competitors at the same time**.

- **The Bar Chart:** Shows the top 15 most frequent shared keywords across all competitors at a glance.
- **The Matrix Table:** Lists every shared keyword, its **Competitor Overlap** (e.g., "*4 / 5 sites (80%)*"), the total number of times it was written, and exactly how many times each competitor used it.
- **Why this matters for your content:** If a keyword is used by 5 out of 5 competitors, Google expects to see that topic in any page that wants to rank on page 1.
- **Search Filter Box:** You can type any word into the table filter box to immediately see if competitors mentioned it and how many times.

Tab 2: Competitor Deep Dive

Allows you to inspect any competitor individually:

- **Domain Pills:** Click on any competitor button (e.g., `competitor1.com`) to view their specific statistics.
- **Top 20 Keywords Chart & Table:** Shows their exact highest-frequency keywords, how many times they appear, and their density percentage.
- **Crawled Pages Directory:** A complete list of all 20–40 pages scraped from that competitor, their page titles, word counts, and a direct link to visit the original page.

Tab 3: Google Autocomplete Suggestions

This tab displays real-time search queries scraped directly from Google's live autocomplete dropdown for your keyword.

- These chips represent related questions and search variations that real users are actively typing into Google.
- **1-Click Re-Analysis:** Clicking on any suggestion chip automatically puts it into the search box and lets you run a fresh analysis for that sub-topic.

Tab 4: Organic SERP Results

Shows the original Google search engine results page as it appeared:

- Every ranked listing (#1, #2, #3, etc.) with title, domain, and meta snippet.
- Shows which websites were selected as business competitors and which links were automatically filtered out (e.g. Reddit forums, social media, or ads).

5. How to Export & Download Your Reports

In the top-right corner of the Results section, you have five instant download options:

Export Format	What Is Included	Best Used For
Download in Word (.docx)	A complete, publication-grade Microsoft Word document featuring: • Executive cover header & KPI summary • High-resolution embedded dominance chart • Full keyword dominance matrix tables • Individual competitor deep-dive breakdowns	**Handing to writers or clients.** It is 100% formatted with professional corporate styling and ready to print or email.
Download Chart PNG	A clean, high-resolution PNG image of the Keyword Dominance bar chart.	Client presentations, slide decks, and marketing proposals.
Export CSV	Raw spreadsheet data with rank, keyword, overlap count, frequency, and per-domain breakdown.	Opening in Microsoft Excel or Google Sheets for custom formulas or sorting.
Save HTML	A self-contained HTML webpage containing the interactive charts.	Saving a permanent offline copy that anyone can open in any browser without installing anything.
Markdown	A clean text document with markdown headers and tables.	Pasting into Notion, GitHub, Obsidian, or documentation wikis.

6. Practical Tips: How to Write an Article Using This Data

Here is the exact 4-step workflow to turn this data into a top-ranking article or service page:

1. **Identify the "Must-Have" Topics (100% Overlap):** Look at the Keyword Dominance Matrix table. Any keyword that has *4/5 or 5/5 competitor presence* is a core requirement. Create an **H2 or H3 heading** in your outline covering that topic.
2. **Match the Average Word Count:** Check the *Total Words Parsed* KPI. Divide that by the number of pages to see the average page length. If competitors average 1,500 words on their top pages, aim for 1,600–1,800 words of higher-quality content.
3. **Use 2–3 Word Phrases for Natural Flow:** Set the N-Gram filter to *Phrases (2-3 words)*. Work these phrases naturally into your body text and bullet points instead of stuffing single words repeatedly.
4. **Answer Google Suggestions:** Grab the top 3–5 questions from the *Google Suggestions* tab and turn them into an **FAQ section** at the bottom of your page.

7. Frequently Asked Questions (FAQ)

Q: Why does the analysis take 30 to 60 seconds?
A: Unlike basic SEO tools that only check one URL, this tool connects to Google, identifies top competitors, and crawls up to 100+ separate web pages live. Scraping and analyzing 100 pages in ~40 seconds is extraordinarily fast.

Q: What happens if a competitor website blocks crawlers?
A: The engine includes automatic bot-protection bypass headers. If a specific page is strictly locked behind a firewall or captcha, the crawler politely skips that single page and continues crawling the remaining pages so your report never fails.

Q: Do I have to pay anything to keep this running?
A: No. It is hosted on Render's 100% free cloud tier and uses organic Google scraping. There are zero subscription fees or hidden costs.

Q: Where is my deployed web dashboard located?
A: Your live web app is accessible at: `https://web-content-analyzer.onrender.com/`
